Cystic Fibrosis

Your Result

You are not likely to be a carrier for cystic fibrosis.

- **No genetic variants found**
- **Carrier, no signs** likely shows signs of cystic fibrosis

Here's What You Need to Know

This test ruled out the most common genetic variants in the *CFTR* gene.

It's unlikely your children will be born with cystic fibrosis.

Even though this test didn’t identify any variants, there is a small chance that you still could be a carrier. The risk level depends in part on your ethnic background, as noted below.

View the list of genetic variants we test.

Here’s what you can do

1. For most people, there’s nothing more you need to do based on this result.

2. If you have a family history of cystic fibrosis, you may want to consider more-comprehensive testing. What will more testing tell me?

Ask a Question

Chance of having a genetic variant based on this test:

- **Non-Hispanic White**
  - 1 in 200 (0.5%)
- **Ashkenazi Jewish**
  - 1 in 380 (0.3%)
- **Hispanic White**
  - 1 in 200 (0.5%)
- **Asian-American**
  - 1 in 180 (0.6%)
- **African-American**
  - 1 in 170 (0.6%)
- **Other/Mixed race**
  - No specific data is available.
